

ADDITIONAL PRODUCT INFORMATION – COLLETS AND GUIDE BUSHES

Guide Bushes with Extended Carbide

Originally the thinking on traditional Swiss type autos was to only feed the material out from the bush. However with the increased capabilities of modern CNC sliding head machines creating the need for a more flexible and adaptable range of tooling we can offer a guide bush with longer carbide that allows the material to be drawn back into the bush (for example when screw-cutting long threads).

These are the main options on length: From 25mm up to 28mm

From 29mm up to 35mm

From 36mm up to 40mm

Above 40mm is possible but will be quoted on demand.

** Please enquire for prices relative to the bush type and length of carbide to suit your application.*

Guide Bushes with Rear Guide

In some applications where small diameter bar is being used problems may be experienced when loading bar. We can help with this problem by supplying guide bushes with a rear guide to centralise the bar when it is being fed, thereby easing the passage of the bar into the bush and helping to prevent snagging and bending caused by the bar hitting the back of the bush.
